Unit 1: Programming

Unit code H/618/7388

Unit type Core

Unit level 4

Credit value 15

Introduction

Programming involves describing processes and procedures that are derived from algorithms. The ability to program is what sets apart a developer and an end user. Typically, the role of the developer is to instruct a device (such as a computer) to carry out instructions; the instructions are known as source code and are written in a language that is converted into something the device can understand. The device executes the instructions it is given.

Algorithms help to describe the solution to a problem or task by identifying the data and the process needed to represent the problem or task *and* the set of steps needed to produce the desired result. Programming languages typically provide the representation of both the data and the process; they provide control constructs and data types (which can be numbers, words and objects, and be constant or variable). The control constructs are used to represent the steps of an algorithm in a convenient yet unambiguous fashion. Algorithms require constructs that can perform sequential processing, selection for decision making and iteration for repetitive control. Any programming language that provides these basic features can be used for algorithm representation.

This unit introduces students to the core concepts of programming along with an introduction to algorithms and the characteristics of programming paradigms. Among the topics included in this unit are: introduction to algorithms, procedural, object-orientated and event-driven programming, security considerations, the integrated development environment and the debugging process.

On successful completion of this unit, students will be able to design and implement algorithms in a chosen language in a suitable Integrated Development Environment (IDE). This IDE will be used to develop and help track any issues with the code. As a result, students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Define basic algorithms to carry out an operation and outline the process of programming an application
- LO2 Explain the characteristics of procedural, object-orientated and event-driven programming
- LO3 Implement basic algorithms in code using an IDE
- LO4 Determine the debugging process and explain the importance of a coding standard.

Essential Content

LO1 Define basic algorithms to carry out an operation and outline the process of programming an application

Algorithm definition:

Writing algorithms to carry out an operation, e.g. Bubble sort.

The relationship between algorithms and code.

The generation process of code; the roles of the pre-processor, compiler and linker, interpreter.

LO2 Explain the characteristics of procedural, object-orientated and event-driven programming

Characteristics of code:

Definitions of: data types (the role of constants/variables), data structures, e.g. arrays, stacks, queues, methods (including input/output), control structures, iteration, scope, parameter passing, classes, inheritance and events.

Key components of an IDE, with a brief explanation of each component.

Use of addition of advanced text editors to view code, such as Notepad++, Atom, Sublime Text etc.

LO3 Implement basic algorithms in code using an IDE

Implementation:

Develop simple applications that implement basic algorithms, including the features of a suitable language and IDE.

Create logical and maintainable codes.

Consideration of security concerns and how they could be solved.

Build, manage and deploy code to the relevant environment to solve the identified problems.

LO4 Determine the debugging process and explain the importance of a coding standard

Review and reflection:

Documentation of the debugging process in the IDE, with reference to watch lists, breakpoints and tracing.

Use of debugging the process to help developers fix vulnerabilities, defects and bugs in code.

Apply structured techniques to problem solving, debugging code and consider structure of programmes to identify and resolve issues.

Understand coding standards and their benefits when writing code.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Define basic algorithms to carry out an operation and outline the process of programming an application		D1 Evaluate the implementation of an algorithm in a suitable language and the relationship between the written algorithm and the code variant.
P1 Define an algorithm and outline the process in building an application. P2 Determine the steps taken from writing code to execution.	M1 Analyse the process of writing code, including the potential challenges faced.	
LO2 Explain the characteristics of procedural, object-orientated and event-driven programming		D2 Critically evaluate the source code of an application that implements the procedural, object-orientated and event-driven paradigms, in terms of the code structure and characteristics.
P3 Discuss what procedural, object-orientated and event-driven paradigms are; their characteristics and the relationship between them.	M2 Compare the procedural, object-orientated and event-driven paradigms used in given source code of an application.	
LO3 Implement basic algorithms in code using an IDE		D3 Evaluate the use of an IDE for development of applications contrasted with not using an IDE.
P4 Write a program that implements an algorithm using an IDE.	M3 Enhance the algorithm written, using the features of the IDE to manage the development process.	
LO4 Determine the debugging process and explain the importance of a coding standard		D4 Evaluate the role and purpose of a coding standard and why it is necessary in a team as well as for the individual.
P5 Explain the debugging process and the debugging facilities available in the IDE. P6 Explain the coding standard you have used in your code.	M4 Examine how the debugging process can be used to help develop more secure, robust applications.	

Recommended Resources

This unit does not specify which programme language should be used to deliver the content – this decision can be made by the tutor.

Examples of languages that are used in industry are C#, Python, Ruby and Java, but any language that will allow students to achieve the Learning Outcomes is acceptable.

Introduction

Computer networks are the driving force behind the evolution of computer systems and allow users to access data, hardware, and services regardless of their location. Being knowledgeable about the underlying principles of networking is of vital importance to all IT professionals. Networking is an environment that is increasingly complex and under continuous development.

Complex computer networking has connected the world by groups of small networks through internet links to support global communications. It supports access to digital information any time, anywhere, using many applications like email, audio and video transmission, including the World Wide Web, and this has opened the floodgates to availability of information.

The aim of this unit is to give students a wider background knowledge of computer networking essentials, how they operate, protocols, standards, security considerations and the prototypes associated with a range of networking technologies. Students will explore a range of hardware, with related software, and will configure and install these to gain knowledge of networking systems. A range of networking technologies will be explored to deliver a fundamental knowledge of Local Area Networking (LAN), Wide Area Networking (WAN) and their evolution to form large-scale networks. Students will also explore the protocol methodologies related to IP data networks.

On successful completion of this unit, students will have gained the knowledge and skills needed to successfully install, operate and troubleshoot a small network; and the operation of IP data networks, router, switching technologies, IP routing technologies, IP services and basic troubleshooting. Supporting a range of units in the Higher National suite, this unit underpins the principles of networks for all and enables students to work towards their studies in vendor units, if applicable. Students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Examine networking principles and their protocols
- LO2 Explain networking devices and operations
- LO3 Design efficient networked systems
- LO4 Implement and diagnose networked systems.

Essential Content

LO1 Examine networking principles and their protocols

Introduction to networks:

Impact of networks on daily lives, the basic requirements of a reliable network, employment opportunities in the networking field, network common network attacks, network trends, e.g. bring your own device (BYOD).

Role of networks:

Purpose, benefits, resource implications, communications, e.g. transmission mediums, working practice, commercial opportunity, information sharing, collaboration.

System types:

Peer-based, client-server, cloud, cluster, centralised, virtualised.

Networking standards:

Conceptual models, e.g. OSI model, TCP/IP model; standards, e.g. IEEE 802.x.

Topology:

Network representation logical, e.g. ethernet, Token Ring; physical, e.g. star, ring, bus, mesh, tree.

Protocols:

Purpose of protocols; adherence, routed protocols, e.g. IPv4 (addressing, subnetting, VLSM), IPv6 (addressing); global unicast, multicast, link local, unique local, EUI 64, auto configuration, ICMP, FTP, HTTP, SMTP, POP3, SSL; management of protocols for addressing.

Wireless networks:

Explore the use and evolution and industry developments in mobile/cellular networks, including key technologies; standards for communications (3G, 4G, 5G); process of accessing and connecting to NB-IoT, GPRS and Wi-Fi networks.

Distinguish between NB-IoT and Wi-Fi AT command sets.

LO2 Explain networking devices and operations

Networking devices:

Explain the operation of server, hub, routers, switches, multilayer switch (including their operating systems, e.g. CISCO IOS, etc.), firewall, Host-based Intrusion System (HIDS), repeaters, bridges, wireless devices, access point (wireless/wired), content filter, load balancer, modem, packet shaper, VPN concentrator.

Explore the basic concepts, features and key technologies of IoT gateways, including IoT gateway solutions, industrial IoT gateway positioning, edge computing, network topologies, RF mesh, Smart Home networks, acceleration, Wi-Fi coverage and intelligent services and serial data transmission (binary data).

Networking software:

Client software, server software, client operating system, server operating system, firewall.

Server type:

Web, file, database, combination, virtualisation, terminal services server.

Server selection:

Cost, purpose, operating system requirement.

Workstation:

Hardware, e.g. network card, cabling.

System bus and local-system architecture, e.g. memory, processor, I/O devices.

Permissions.

LO3 Design efficient networked systems

Bandwidth:

Expected average load, anticipated peak load, local internet availability, cost constraints, throughput.

Users:

Quality expectations, concept of system growth.

Consider what the network will be used for (purpose) according to the scenario.

Networking services and applications:

DHCP, including static vs dynamic IP addressing, reservations, scopes, leases, options (DNS servers, Suffixes), IP helper, DHCP relay, DNS records, Dynamic DNS, static and dynamic routing between multiple subnets.

Calculate IP subnet address ranges in dotted decimal and binary.

Calculate subnet masks.

Communications:

Ensuring communications are suited to devices, suited to users, supportive of lifestyle desires, supportive of commercial requirements, security requirements, quality of service needs.

Scalability:

Ability to support device growth, able to support addition of communication devices, able to cope with bandwidth use and trend changes, protocol utilisation, addressing, multiple subnets, dynamic, static routing protocols.

Selection of components:

Supporting infrastructure needs; supporting connectivity requirements.

Security:

The concept of 'secure by design' and its application to infrastructure.

Security considerations when designing a network for an identified scenario, e.g. shared data, network access, remote workers, public facing systems, internal policy.

LO4 Implement and diagnose networked systems

Devices:

Installation of communication devices, allocation of addresses, local client configuration, server configuration, server installation, security considerations.

Verification of configuration and connectivity:

Installation of internet work communication medium, ping, extended ping, traceroute, telnet, SSH.

Evidence the system meets design requirements, including security controls as required by the scenario, have been implemented.

System monitoring:

Utilisation, bandwidth needs, monitoring user productivity and security of the system. Factors affecting network performance.

Identify typical failure modes in protocols and approaches to error control.

Review network monitoring data to optimise performance and undertake root cause analysis of events and make recommendations to reduce false positives and false negatives.

Network automation:

Process of setting up software to automatically manage, configure, test, deploy, and operate network devices (physical or virtual).

Maintenance schedule:

Backups, upgrades, security, auditing.

Diagnose and resolve layer 1 problems:

Explore the E2E integrated development and testing process.

Framing, CRC, runts, giants, dropped packets, late collisions, input/output errors.

Policy review:

Bandwidth, resource availability.

Service level agreements (SLAs):

Conditions of service availability, time window for each level of service (prime time and non-prime time), responsibilities of each party, escalation procedures, and cost/service trade-offs.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine networking principles and their protocols		
<p>P1 Discuss the benefits and constraints of different network types and standards.</p> <p>P2 Explain the impact network topologies have on communication and bandwidth requirements.</p>	<p>M1 Assess common networking principles and how protocols enable the effectiveness of networked systems.</p>	<p>D1 Evaluate the topology and protocol suite selected for a given scenario and how it demonstrates the efficient utilisation of a networking system.</p>
LO2 Explain networking devices and operations		
<p>P3 Discuss the operating principles of networking devices and server types.</p> <p>P4 Discuss the interdependence of workstation hardware and relevant networking software.</p>	<p>M2 Explore a range of server types and justify the selection of a server for a given scenario, regarding cost and performance optimisation.</p>	
LO3 Design efficient networked systems		<p>D2 Critically reflect on the implemented network, including the design and decisions made to enhance the system.</p>
<p>P5 Design a networked system to meet a given specification.</p> <p>P6 Design a maintenance schedule to support the networked system.</p>	<p>M3 Analyse user feedback on your designs with the aim of optimising your design and improving efficiency.</p>	
LO4 Implement and diagnose networked systems		
<p>P7 Implement a networked system based on a prepared design.</p> <p>P8 Document and analyse test results against expected results.</p>	<p>M4 Recommend potential enhancements for the networked systems.</p>

Introduction

In the workplace, it is essential to be effective as a communicator, critical thinker, analyser, team worker and team leader. These skills are needed on a daily basis in order to carry out designated tasks as part of a job role. The development of academic competence and the continuation of lifelong learning and continuing professional development (CPD) are required to ensure that individuals have a valued set of interpersonal skills that can be applied to any situation or environment.

This unit provides a foundation for good practice in a variety of contexts. The ability to communicate effectively using different tools and mediums will ensure that practical, research, design, reporting and presentation tasks are undertaken professionally and in accordance with various communication conventions. In everyday life, the ability to apply critical reasoning and solve problems are skills that enable tasks to be completed successfully and facilitate effective decision making. Working with others in a group environment such as an academic setting or in the workplace is an integral part of everyday life. Therefore, understanding the dynamics of teams in terms of culture, roles and responsibilities will ensure that there is a better understanding and awareness of the importance and value of teamwork. Continuing professional development, self-improvement, reflective practice and working towards various goals are encouraged in the workplace through an appraisal framework. Professional development includes at higher levels of learning and the ability to demonstrate effective research skills and academic reporting skills.

This unit covers the development of communication skills and communication literacy and the use of qualitative and quantitative data to demonstrate analysis, reasoning and critical thinking. Students will carry out tasks that require working with others in a team-based scenario and planning and problem solving.

On successful completion of the unit, students will be able to demonstrate leadership skills through the dynamics of team working. Through reflective practice, they will be able to evaluate the contributions they make as an individual and those of others.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Demonstrate a range of interpersonal and transferable communication skills to a target audience
- LO2 Apply critical reasoning and thinking to a range of problem-solving scenarios
- LO3 Discuss the importance and dynamics of working within a team and the impact of team working in different environments
- LO4 Examine the need for continuing professional development (CPD) and its role within the workplace and for higher-level learning.

Essential Content

LO1 **Demonstrate a range of interpersonal and transferable communication skills to a target audience**

Effective communication:

Verbal and non-verbal, e.g. awareness and use of body language, openness and responsiveness, formal and informal dialogue and feedback to a range of different stakeholders, academic report writing, use of IT to enhance communication, use of source information to undertake research.

Understanding of the reasons for communicating with internal and external stakeholders, e.g. responding to queries, technical support, providing instructions, raising awareness of issues.

Considerations when communicating with internal and external stakeholders, e.g. maintaining privacy and security, tone of voice, use of technical vocabulary or jargon, company image.

Consideration of issues relating to inclusion and diversity when communicating and interacting with others.

Interpersonal skills:

Soft skills, e.g. personal effectiveness, working with others, use of initiative, negotiating skills, assertiveness skills and social skills.

Time-management skills:

Prioritising workloads, setting objectives, using time effectively, making and keeping appointments, planning and scheduling tasks and activities.

LO2 **Apply critical reasoning and thinking to a range of problem-solving scenarios**

Specification of the problem:

Definition of the problem; analysis and clarification.

Identification of possible outcomes:

Identification and assessment of various alternative outcomes.

Tools and methods:

Use of problem-solving methods and tools.

Demonstrate resourcefulness and creativity when solving problems.

Plan and implement:

Sources of information, solution methodologies, selection and implementation of the best corrective action, e.g. timescale, stages, resources, critical path analysis.

Evaluation:

Evaluation of problem solving, measurement of solution against specification and desired outcomes, sustainability.

LO3 Discuss the importance and dynamics of working within a team and the impact of team working in different environments

Working with others:

Nature and dynamics of team and group work, informal and formal settings.

Purpose of teams and groups, e.g. long-term corporate objectives and strategy, problem-solving and short-term development projects, flexibility and adaptability, team player.

Individual responsibility when working as part of a team.

Working effectively on individual and collaborative tasks regardless of levels of supervision.

Allocation and management of tasks between members of the team, identifying team members' strengths, communicating requirements and expectations effectively.

Teams and team building:

Selecting team members e.g. specialist roles, skill and style/approach mixes.

Identification of team and work group roles.

Stages in team development, including team building, identity, loyalty, commitment to shared beliefs, professionalism.

Team health evaluation, including promoting and maintaining a safe and secure working environment, action planning, monitoring and feedback, coaching skills, ethics.

Effective leadership skills, e.g. setting direction, setting standards, motivating, innovative, responsive, effective communicator, reliability, consistency.

LO4 Examine the need for continuing professional development (CPD) and its role within the workplace and for higher-level learning

Responsibilities:

Own responsibilities, e.g. personal responsibility, direct and indirect relationships and adaptability, decision-making processes and skills, ability to learn and develop within the work role.

Other responsibilities, including employment legislation, ethics, employment rights and responsibilities.

Maintaining a productive, professional and secure working environment.

Performance objectives:

Setting and monitoring performance objectives, measurement tools for success and achievement.

CPD, including lifelong learning, training and development, personal development, professional development.

Evidence criteria:

Production data, personnel data, judgemental data.

Rating methods, e.g. ranking, paired comparison, checklist, management by objectives.

Skills audit, including personal profile using appropriate self-assessment tools, evaluating self-management.

Personal and interpersonal skills.

Motivation and performance:

Application and appraisal of motivational theories and techniques, rewards and incentives; manager's role; self-motivational factors.

Development plan:

Plan to include current performance, future needs, opportunities and threats to career progression, aims and objectives, achievement dates, review dates, learning programme or activities, action plans, personal development plans, ongoing commitment to CPD.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Demonstrate a range of interpersonal and transferable communication skills to a target audience		D1 Evaluate the effectiveness and application of interpersonal skills used in the design and delivery of a training event.
<p>P1 Demonstrate effective design and delivery of a training event for a given target audience, using different communication styles and formats.</p> <p>P2 Demonstrate effective time-management skills in planning an event.</p>	<p>M1 Design a professional schedule to support the planning of an event, to include contingencies and justifications of time allocated.</p>	
LO2 Apply critical reasoning and thinking to a range of problem-solving scenarios		D2 Evaluate the overall success of the event delivered, in terms of how well critical reasoning and thinking were applied to achieve the end goal.
<p>P3 Demonstrate the use of different problem-solving techniques in the design and delivery of an event.</p> <p>P4 Demonstrate that critical reasoning has been applied to the design and delivery of the event.</p>	<p>M2 Research the use of different problem-solving techniques used in the design and delivery of an event.</p> <p>M3 Justify the use and application of a range of methodologies in the design and delivery of an event.</p>	

Pass	Merit	Distinction
<p>L03 Discuss the importance and dynamics of working within a team and the impact of team working in different environments</p>		<p>D3 Critically evaluate your own role and contribution to a group scenario.</p>
<p>P5 Discuss the importance of team dynamics in the success and/or failure of group work.</p> <p>P6 Work in a team to achieve a defined goal.</p>	<p>M4 Analyse team dynamics, in terms of the roles that group members play in a team and the effectiveness in terms of achieving shared goals.</p>	
<p>L04 Examine the need for Continuing Professional Development (CPD) and its role within the workplace and for higher-level learning</p>		<p>D4 Evaluate a range of evidence criteria that is used as a measure for effective CPD.</p>
<p>P7 Discuss the importance of CPD and its contribution to own learning and motivation.</p> <p>P8 Review different motivational theories and the impact they can have on performance in the workplace.</p> <p>P9 Produce a development plan that outlines responsibilities, performance objectives and required skills for future goals.</p>	<p>M5 Justify the role of CPD and development planning in building motivation.</p>

Introduction

Organisations depend on their databases for providing information that is essential for their day-to-day operations and to help them take advantage of today's rapidly growing and maturing e-commerce opportunities. An understanding of database tools and technologies is an essential skill for designing and developing systems to support them.

As applications get increasingly more sophisticated, database systems continue to demand more complex data structures and interfaces. Most organisations collect and store large volumes of data, either on their own systems or in the cloud, and this data is used not just for the operational running of their business but is also mined for other more intelligent and complex applications. Databases stand as the back-end of most systems used by organisations for their operations.

Database design and development is a fundamental and highly beneficial skill for computing students to master, regardless of their specialism.

The aim of this unit is to give students opportunities to develop an understanding of the concepts and issues relating to database design and development. It will also provide the practical skills needed to be able to translate that understanding into the design and creation of complex databases.

Topics covered in this unit are: examination of different design tools and techniques; examination of different development software options; consideration of the development features of a fully-functional robust solution covering data integrity, data validation, data consistency, data security and advanced database querying facilities across multiple tables; appropriate user interfaces for databases and for other externally linked systems; creating complex reports/dashboards, testing the system against the user and system requirements; and elements of complete system documentation.

On successful completion of the unit, students will be able to use appropriate tools to design and develop a relational database system for a substantial problem. They will be able to test the system to ensure that it meets user and system requirements, and fully document the system by providing technical and user documentation. For practical purposes, this unit covers relational databases and related tools and techniques. A brief overview of object-oriented databases will also be covered. As a result, students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Use an appropriate design tool to design a relational database system for a substantial problem
- LO2 Develop a fully-functional relational database system, based on an existing system design
- LO3 Test the system against user and system requirements
- LO4 Produce technical and user documentation.

Essential Content

LO1 Use an appropriate design tool to design a relational database system for a substantial problem

Database design:

Principles and uses of relational and non-relational databases.

The role of database systems, e.g. as back-end systems, in e-commerce, for data mining applications, blockchain.

Determining user and system requirements.

Design tools and techniques for a relational database system.

Logical design for relational databases, including structured data in tables, data elements, data types, indexes, primary and foreign keys, entity relationship modelling, referential integrity, data normalisation to third normal form.

Designs for data integrity, data validations, data security and data controls. User interface design.

Output designs for user requirements.

Overview of object-oriented databases and their design tools.

LO2 Develop a fully-functional relational database system, based on an existing system design

Implementation:

Consideration of database and platform options for system development.

Examination of different software development options for developing the relational database system.

Implementation of the physical data model based on the logical model and linking code to data sets.

Data stores, internal storage and external storage, e.g. the cloud.

Implementation of security elements in databases.

Relational databases with controls like data validation using; input masks, dropdown lists, option buttons.

Consideration of user interface requirements looking at functionality, reliability, consistency, performance and accessibility for a range of different users.

Develop effective user interfaces linked with other systems, e.g. internet-based applications.

Data manipulation using appropriate query tools, including complex queries to query across multiple tables and using functions and formulae.

Database maintenance and data manipulation: inserts, updates, amendments, deletions, data backup and recovery.

System reports using report-writing tools and report generators, dashboards.

Implementation of security elements in a database, including consideration of permissions, access rights, network vulnerabilities, physical location of data, multi-tenancy and data separation, encryption.

Consideration of GDPR issues, including data crossing borders and other nations' data protection regulations.

LO3 **Test the system against user and system requirements**

Testing methodologies:

Identify elements of the system that need to be tested. Consider data that should be used to fully test the system.

Match tests against user and system requirements.

Test procedures to be used: test plans, test models, e.g. white box, black box; testing documentation.

Functional and system testing and testing the robustness of the system, including help menus, pop-ups, hot-spots, data validation checks.

LO4 **Produce technical and user documentation**

Structure and functionality documentation:

Technical and user documentation and their contents.

Technical documentation to include diagrams showing movement of data through the system and flowcharts describing how the system works.

User documentation, including how to use the system, outputs produced by the system, menu operations and other functions.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
L01 Use an appropriate design tool to design a relational database system for a substantial problem		D1 Evaluate the effectiveness of the design in relation to user and system requirements.
P1 Design a relational database system using appropriate design tools and techniques, containing at least four interrelated tables, with clear statements of user and system requirements.	M1 Produce a comprehensive design for a fully-functional system, which includes interface and output designs, data validations and data normalisation.	
L02 Develop a fully-functional relational database system, based on an existing system design		D2 Evaluate the effectiveness of the database solution in relation to user and system requirements and suggest improvements.
P2 Develop the database system with evidence of user interface, output and data validations, and querying across multiple tables.	M2 Implement a fully-functional database system, which includes system security and database maintenance.	
P3 Implement a query language into the relational database system.	M3 Assess whether meaningful data has been extracted through the use of query tools to produce appropriate management information.	
L03 Test the system against user and system requirements		
P4 Test the system against user and system requirements.	M4 Assess the effectiveness of the testing, including an explanation of the choice of test data used.	

Pass	Merit	Distinction
LO4 Produce technical and user documentation		
P5 Produce technical and user documentation.	M5 Produce technical and user documentation for a fully-functional system, including data flow diagrams and flowcharts, describing how the system works.

Unit 5: Security

Unit code	D/618/7406
Unit type	Core
Unit level	4
Credit value	15

Introduction

Security is one of the most important challenges modern organisations face. It is about protecting organisational assets, including personnel, data, equipment and networks, from attack through the use of prevention techniques in the form of vulnerability testing/security policies and detection techniques, exposing breaches in security and implementing effective responses.

The aim of this unit is to give students knowledge of security, the associated risks and how it has an impact on business continuity. Students will examine security measures involving access authorisation and regulation of use. They will implement contingency plans and devise security policies and procedures. The unit also introduces students to detection of threats and vulnerabilities in physical and IT security, and how to manage risks relating to organisational security.

This unit includes network security design and operational topics, including address translation, DMZ, VPN, firewalls, AV and intrusion detection systems. Remote access will be covered, as will the need for frequent vulnerability testing as part of organisational and security audit compliance. As a result, students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

LO1 Assess risks to IT security

LO2 Describe IT security solutions

LO3 Review mechanisms to control organisational IT security

LO4 Manage organisational security.

Essential Content

LO1 Assess risks to IT security

IT security risks:

Risks of unauthorised use of a system, including unauthorised removal or copying of data or code from a system, damage to or destruction of physical system assets and environment, damage to or destruction of data or code inside or outside the system, naturally occurring risks, internal and external sources of risk.

Legal restrictions on the access to data, including UK and international data laws (walled garden laws), e.g. General Data Protection Regulation (UK) (GDPR).

Organisational security, including business continuance, backup/restoration of data, audits, areas of systems to be secured, e.g. data, network, systems (hardware and software), WANs, intranets, wireless access systems, security culture and the approaches to security in the work place, operational impact of security breaches.

The concepts, main functions and features of a range of Operating Systems (OS) and their security functions and associated security features.

LO2 Describe IT security solutions

IT security solution evaluation:

Network security infrastructure, including evaluation of network address translation (NAT), demilitarized zone (DMZ), static and dynamic IP addresses.

Network performance: redundant array of inexpensive disks (RAID), Main/Standby, Dual LAN, web server balancing.

Data security, including asset management, image differential/incremental backups, storage area network (SAN) servers, encryption.

Data centre, including replica data centres, virtualisation, secure transport protocol, secure MPLS routing, segment routing and remote access methods/procedures for third-party access, physical mechanisms, e.g. air flow and cooling to prevent overheating.

Security vulnerability, including logs, traces, honeypots, data mining algorithms, vulnerability testing, zero-day exploits.

Educating staff and customers on IT security issues and prevention methods.

Understand how cyber security technology components are typically deployed in digital systems to provide security and functionality, including hardware and software to implement security controls.

LO3 Review mechanisms to control organisational IT security

Mechanisms to control organisational IT security:

Risk assessment and integrated enterprise risk management: network change management, audit control, business continuance/disaster recovery plans, potential loss of data/business, intellectual property, hardware and software.

Probability of occurrence, e.g. disaster, theft.

Staff responsibilities.

Legal mechanisms, both UK and international, including Data Protection Act 2018, Computer Misuse Act 1990 and amendments, ISO 31000 Risk Management standards.

Company regulations: site or system access criteria for personnel; physical security types, e.g. biometrics, swipe cards, theft prevention.

Awareness of common security architectures and methodologies that incorporate hardware and software components, and sources of architecture patterns and guidance.

Assess the security culture within an organisation (the approach to security, including how user actions impact on security).

Ensure system defences are informed by the most up-to-date legislation and guidance on best practice from professional bodies.

LO4 **Manage organisational security**

Manage organisational security:

Organisational security policies, e.g. system access, access to internet email, access to internet browser, development/use of software, physical access and protection, third-party access, business continuity, responsibility matrix.

Reviewing and monitoring of security risk assessments and ensuring stakeholder compliance with security procedures and standards.

Collect information from various sources (e.g. log files, system monitoring tools, Secure Information and Event Management (SIEM) tools, access control systems, physical security systems) and compare to known threat and vulnerability data to determine a digital system security breach.

Using enterprise risk management (as part of system management and lifecycle) for identifying, evaluating, implementing and follow up of security risks according to ISO 31000 standards.

Understand appropriate security tools and methods, e.g. user log-on profiles to limit user access to resources, online software to train and update staff.

Auditing tools to monitor resource access, security audits and penetration testing.

Investigate organisation policy on ethical hacking and bug bounties.

Gathering and recording information on security and initiating suitable actions for remediation.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Assess risks to IT security		D1 Evaluate a range of physical and virtual security measures that can be employed to ensure the integrity of organisational IT security.
P1 Discuss types of security risks to organisations. P2 Assess organisational security procedures.	M1 Analyse the benefits of implementing network monitoring systems with supporting reasons.	
LO2 Describe IT security solutions		
P3 Discuss the potential impact to IT security of incorrect configuration of firewall policies and third-party VPNs. P4 Discuss, using an example for each, how implementing a DMZ, static IP and NAT in a network can improve network security.	M2 Propose a method to assess and treat IT security risks.	
LO3 Review mechanisms to control organisational IT security		D2 Recommend how IT security can be aligned with an organisational policy, detailing the security impact of any misalignment.
P5 Review risk assessment procedures in an organisation. P6 Explain data protection processes and regulations as applicable to an organisation.	M3 Summarise an appropriate risk-management approach or ISO standard and its application in IT security. M4 Analyse possible impacts to organisational security resulting from an IT security audit.	

Pass	Merit	Distinction
LO4 Manage organisational security		
<p>P7 Design a suitable security policy for an organisation, including the main components of an organisational disaster recovery plan.</p> <p>P8 Discuss the roles of stakeholders in the organisation in implementing security audits.</p>	<p>M5 Justify the security plan developed giving reasons for the elements selected.</p>

Unit 32: Information Security Management.

Unit 6: Planning a Computing Project (Pearson-set)

Unit code H/618/7407

Unit type Core

Unit level 4

Credit value 15

Introduction

This unit is assessed through a Pearson-set assignment. The project brief will be set by the centre, based on a theme provided by Pearson (this will change annually). The theme and chosen project within the theme will enable students to explore and examine a relevant and current topical aspect of computing in the context of a business environment.

As computing systems and technologies continually develop so do the ways in which businesses utilise technologies to support their operations and remain competitive. As a computing professional it is important to understand the ways in which technology evolves and how it can be utilised in different sectors.

The aim of this unit is to give students an opportunity to demonstrate the research skills required for developing a deeper understanding of a subject and the ability to use evidence to inform decisions. Students will undertake independent research, and investigation of a theme set by Pearson. Students will also investigate and research an industry sector as outlined in the centre-set project brief. Students will use the outcomes of their research to help them plan a computer-based project and to support recommendations for how the identified business could utilise the tools and technologies identified as part of their research.

On successful completion of this unit, students will have the confidence to engage in decision making, problem solving, research activities and project planning tasks. They will have the fundamental knowledge and skills that will enable them to investigate and examine relevant computing concepts in a work-related context, determine appropriate outcomes, decisions or solutions and present evidence to various stakeholders in an acceptable and understandable format.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Conduct small-scale research, information gathering and data collection to generate knowledge on an identified subject
- LO2 Explore the features and business requirements of organisations in an identified sector.
- LO3 Produce project plans based on research of the chosen theme for an identified organisation
- LO4 Present your project recommendations and justifications of decisions made, based on research of the identified theme and sector.

Essential Content

LO1 **Conduct small-scale research, information gathering and data collection to generate knowledge on an identified subject**

Project execution phase:

Selecting appropriate methods of information gathering, data collection and material resourcing.

The distinct phases that support a coherent and logical argument. Use of secondary research to inform a primary empirical study.

Qualitative and quantitative research methods.

Field work:

Selecting a sample of the consumer market, businesses or individuals (those who meet certain characteristics relevant to the research theme) used to gather data (qualitative or quantitative).

Sampling approaches and techniques, including probability and non-probability sampling.

Analysing information and data:

Using data collection tools, such as interviews and questionnaires, and their advantages and disadvantages.

Using analytical techniques such as trend analysis, coding and typologies.

Sources of, and access to, data, including open and public data, administrative and sensitive data, research data.

The principles of data to govern data, including data has value, data should be reusable, data is managed according to its value, data should be fit for purpose.

Ethics, reliability and validity:

Ensure that all research is conducted, data stored, processed and used in an ethical way.

Research should also be reliable (similar results achieved from a similar sample) and valid (the research should measure what it aimed to measure).

Ensure validity and reliability of secondary data and information used, including consideration of who wrote or collected the information or data, age of data collected, original purpose of the data collection, potential errors or variability in the data, potential bias, e.g. sample size, sample participants, questions used, interpretation of results.

LO2 Explore the features and business requirements of organisations in an identified sector

Features of businesses:

Types of business, their ownership and liability.

Private, e.g. sole trader, private limited company, public limited company.

Public, e.g. government department, not-for-profit, e.g. charity, voluntary.

Industry sectors, including primary, secondary, tertiary, quaternary.

How an organisation may provide a specific product(s) or service within a sector.

How some organisations provide both products and services.

The concept of diversification to aid business success.

Operational areas of businesses:

The operational areas of a business ('business functions') and how they support the organisation's purpose, e.g. human resources, research and development, sales, marketing, purchasing, production and quality, finance, customer service, IT, administration.

Stakeholders:

Internal stakeholders, e.g. management, employees, shareholders.

External stakeholders, e.g. suppliers, customers, government agencies, communities.

How stakeholders influence business processes and decisions.

The impact of stakeholders on an organisation's success.

Challenges to the success of a business:

Legislation and industry standards relevant to the organisation and sector.

Change management, including planned change, e.g. expansion, diversification, changes in legislation, system upgrades.

Unplanned change, e.g. response to a security breach, disaster response and recovery.

Communication of need for change to stakeholders.

Management of stakeholders before during and after change, e.g. training, target setting, support

Method of implementation of change, e.g. parallel running, direct change over, phased changeover.

Documenting the change process, testing changes to the system and business.

Security and privacy concerns relevant to the organisation and sector.

LO3 Produce project plans based on research of the chosen theme for an identified organisation

Project planning and initiation:

The role of a business or systems analyst and the activities they undertake as part of initiation of a project.

Analysing the features and requirements of an identified organisation to establish their requirements.

Recommend potential solutions to identified business needs, including carrying out a cost/benefit analysis, defining business objectives, scope and purpose of the project.

Comprehensive project plans, including defining functional and non-functional requirements of the system, stakeholder requirements and expectations, carrying out impact analysis, prioritising requirements, describing the deliverables to be produced, timescales and time management, costs, change management planning, risk and challenges analysis.

Success criteria to be used, e.g. Key Performance Indicators (KPIs), performance metrics, quality metrics, and business targets.

Use of an identified project management methodology, e.g. Waterfall, Agile, Rapid Application Development (RAD).

Consider approaches to continuous integration, version and source control.

Tools:

Tools for effective project planning, resource planning and allocation, and work breakdown structure, including Project Initiation Documents (PID), bar and Gantt charts, Critical Path Analysis (CPA), risk matrix.

LO4 Present your project recommendations and justifications of decisions made based on research of the identified theme and sector

Presenting and communicating project recommendations:

Presenting to different technical and non-technical stakeholders, e.g. emphasis on operational or strategic information, technical terminology used, levels of detail given and simplifying concepts.

Consider the methods and mediums to be used, including written or verbal, report, online or presentation.

Understand how project research and intended audience will influence on method and medium.

Justification of decisions made:

Justification of recommendations, including use of key points from cost/benefit analysis, deliverables, success criteria, impact analysis.

Justifications of planning, including chosen development methodology, work and resource allocation, key deadlines and timescales.

Rationale for decisions made in the recommended solution and project plan, including use of research and data for the identified technology and business sector, analysis of evidence and business requirements, contextual factors specific to the identified organisation.

Reflection on the quality of research:

Quality of secondary and primary data used to inform planning and make decisions.

Awareness that some studies may result in generalised findings and how this can impact on the quality of decisions and the accuracy of conclusions made.

Evaluate the quality of the data and information used to inform project initiation plans, e.g. sample size, sample characteristics, user experience during collection, domain context.

Reach conclusions as to the likely accuracy and reliability of assertions made.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Conduct small-scale research, information gathering and data collection to generate knowledge on an identified subject		D1 Interpret findings to generate knowledge on how the research theme supports business requirements in the identified sector.
P1 Demonstrate qualitative and quantitative research methods to generate relevant primary data for an identified theme. P2 Examine secondary sources to collect relevant secondary data and information for an identified theme.	M1 Analyse data and information from primary and secondary sources to generate knowledge on an identified theme.	
LO2 Explore the features and business requirements of organisations in an identified sector		
P3 Discuss the features and operational areas of a businesses in an identified sector. P4 Discuss the role of stakeholders and their impact on the success of a business.	M2 Analyse the challenges to the success of a business in an identified sector.	

Pass	Merit	Distinction
L03 Produce project plans based on research of the chosen theme for an identified organisation		D2 Evaluate the project planning recommendations made in relation to the needs of the identified organisation and the accuracy and reliability of the research carried out.
P5 Devise comprehensive project plans for a chosen scenario, including a work and resource allocation breakdown using appropriate tools.	M3 Produce comprehensive project plans that effectively consider aims, objectives and risks/benefits for an identified organization.	
L04 Present your project recommendations and justifications of decisions made, based on research of the identified theme and sector		
<p>P6 Communicate appropriate project recommendations for technical and non-technical audiences.</p> <p>P7 Present arguments for the planning decisions made when developing the project plans.</p> <p>P8 Discuss accuracy and reliability of the different research methods applied.</p>	M4 Assess the extent to which the project recommendations meet the needs of the identified organisation, including fully-supported rationales for planning decisions made.

Unit 17: Business Process Support

Unit 35: Systems Analysis & Design.

Unit 7: Software Development Lifecycles

Unit code K/618/7408

Unit level 4

Credit value 15

Introduction

The software development lifecycle is an integrated process that promotes building good quality, secure software throughout the entire development process. The aim of this unit is to give students the knowledge and skills needed to understand software development lifecycles so that they can demonstrate their knowledge by implementing a software development lifecycle with a suitable methodology.

The unit introduces students to lifecycle decision making at different stages of the software development process. They will examine various lifecycle models and learn to appreciate their particular characteristics in order to understand for which project environments they are most appropriate. Theoretical understanding will be translated into practical skills through an actual software development lifecycle project. Students will become confident in the use of particular tools and techniques relevant to a chosen methodology.

Among the topics included in this unit are iterative and sequential models of software development lifecycles and reference frameworks for initially capturing conceptual data and information through a feasibility study, and requirement gathering techniques through to analysis, design and software implementation activities.

Students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

LO1 Describe different software development lifecycles

LO2 Explain the importance of a feasibility study

LO3 Undertake a software development lifecycle

LO4 Discuss the suitability of software behavioural design techniques.

Essential Content

LO1 Describe different software development lifecycles.

Software development lifecycles:

Describe different software development lifecycles.

Understand and use different lifecycle models, including predictive (Waterfall, Prototyping, RAD), adaptive (Spiral, Agile, DSDM), sequential and iterative software development models.

Lifecycle stage and connectivity, including feasibility study, analysis, design, implementation, testing, review or analysis, design, implementation, maintenance, planning, requirements traceability.

Testing and integration, including relationship between test activities and software development activities, levels of testing, building test environments, developing test harnesses, black box and white box testing, incremental testing, system testing, acceptance test and integration approaches, changeover strategies, trials and Go-Live prerequisites.

Understand the role and utilisation of analysis artefacts:

The creation of analysis artefacts in a software development project, e.g. software requirements specification, use case or user stories, user profiles, workflow model, wireframes, logical data model, data dictionary etc.

The purpose and activities of the gap analysis process.

Roles and responsibilities in a large-scale software project development lifecycle:

Identify the different individuals in a project, e.g. project manager, business analyst, systems analyst, programmer, DevOps engineer, testing engineer etc.

Contributions, including quality assurance, common core skills, tools and behaviours.

Explore how the psychology and mindset of testing differs to that development mindset and their possible influence on the overall success of a software project.

LO2 Explain the importance of a feasibility study

Requirement gathering:

Requirement gathering techniques, including how to categorise, validate and prioritise, e.g. MosCow method, functional requirements, non-functional requirements, users and constraints.

Interviews, observation, investigation.

Importance of feasibility study:

Feasibility criteria considerations, e.g. legal, social, economic, technical, timescales, organisational constraints.

Components of feasibility study, including purpose, structure, intended audience, outcomes.

The purpose of process modelling and the importance of an organisational view of business processes.

Key drivers for change, including performance and efficiency, legacy systems upgrade, automation, elimination of human error.

LO3 Undertake a software development lifecycle

Carry out software development lifecycle:

Follow company, team or client approaches to continuous integration, version and source control.

Apply an appropriate software development approach according to the relevant paradigm, e.g. object oriented, event driven or procedural.

Identify stakeholder requirements.

Scope of project, including inputs, outputs, processes and process descriptors, consideration of alternate solutions and security considerations, required quality assurance and testing.

Constraints specific to activity, e.g. costs, organisational policies, legacy systems, hardware requirements.

Create simple software designs to effectively communicate understanding of the program.

Follow agreed software designs and technical and functional specifications.

Follow organisational policies and procedures relating to the tasks being undertaken, e.g. the storage and treatment of GDPR sensitive data.

Report documentation, including structure, e.g. background information, problem statements, data collection process and summary, recommendations and appendices.

Use of appropriate systems analysis terminology and tools, including data stores and entities, data flows, process representation techniques relationships (1:1, 1:M and M:M).

Investigation, e.g. upgrading computer systems, designing new systems.

Techniques and documents for documenting business requirements and processes relevant to selected methodology, e.g. Context Diagrams, Data Flow Diagrams (DFDs), Entity Relationship Diagrams (ERDs), Business Systems Options (BSOs), Technical Systems Options (TSOs) and requirements traceability.

Analyse documented requirements to remove duplication, conflict and overlap.

Quality considerations, e.g. Total Quality Management (TQM).

LO4 Discuss the suitability of software behavioural design techniques

Evaluate suitability of software behavioural design techniques:

Flowcharts, pseudocode, formal specification methods, event/state/data driven, finite state machines extended-FSM/FSP.

Problem of e-FSM state explosion, reachability analysis, safety, liveness properties.

Automatic analysis and animation tools.

Understand the characteristics of software architecture that impact on software testing in the development lifecycle.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Describe different software development lifecycles		D1 Assess the merits of applying the Waterfall lifecycle model to a large software development project.
<p>P1 Describe two iterative and two sequential software lifecycle models.</p> <p>P2 Explain how risk is managed in software lifecycle models.</p>	<p>M1 Discuss using an example, why a particular lifecycle model is selected for a development environment.</p>	
LO2 Explain the importance of a feasibility study		D2 Assess the impact of different feasibility criteria on a software investigation.
<p>P3 Explain the purpose of a feasibility report.</p> <p>P4 Describe how technical solutions can be compared.</p>	<p>M2 Discuss the components of a feasibility report.</p>	
LO3 Undertake a software development lifecycle		D3 Evaluate the process of undertaking a systems investigation with regard to its effectiveness in improving a software quality.
<p>P5 Undertake a software investigation to meet a business need.</p> <p>P6 Use appropriate software analysis tools/techniques to carry out a software investigation and create supporting documentation.</p>	<p>M3 Analyse how software requirements can be traced throughout the software lifecycle.</p> <p>M4 Discuss two approaches to improving software quality.</p>	
LO4 Discuss the suitability of software behavioural design techniques		D4 Present justifications of how data-driven software can improve the reliability and effectiveness of software.
<p>P7 Discuss, using examples, the suitability of software behavioural design techniques.</p>	<p>M5 Analyse a range of software behavioural tools and techniques.</p> <p>M6 Differentiate between a finite state machine (FSM) and an extended FSM, providing an application of use for both.</p>

Introduction

In 1837, English mathematicians Charles Babbage and Ada Lovelace in collaboration, described a machine that could perform arithmetical operations and store data in memory units. This design of their 'Analytical Engine' is the first representation of modern, general-purpose computer technology. Although modern computers have advanced far beyond Babbage and Lovelace's initial proposal, they still rely fundamentally on mathematics for their design and operation.

This unit introduces students to the mathematical principles and theory that underpin the computing curriculum. Through a series of case studies, scenarios and task-based assessments, students will explore number theory in a variety of scenarios; use applicable probability theory; apply geometrical and vector methodology; and, finally, evaluate problems concerning differential and integral calculus.

Among the topics included in this unit are: prime number theory, sequences and series, probability theory, geometry, differential calculus and integral calculus.

On successful completion of this unit, students will have gained confidence in the mathematics that is needed in other computing units. They will have developed skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

LO1 Use applied number theory in practical computing scenarios

LO2 Analyse events using probability theory and probability distributions

LO3 Determine solutions of graphical examples using geometry and vector methods

LO4 Evaluate problems concerning differential and integral calculus.

Essential Content

LO1 Use applied number theory in practical computing scenarios

Number theory:

Converting between number bases (denary, binary, octal, duodecimal and hexadecimal).

Prime numbers, Pythagorean triples and Mersenne primes. Greatest common divisors and least common multiples.

Modular arithmetic operations.

Sequences and series:

Expressing a sequence recursively.

Arithmetic and geometric progression theory and application. Summation of series and the sum to infinity.

LO2 Analyse events using probability theory and probability distributions

Probability theory:

Calculating conditional probability from independent trials. Random variables and the expectation of events.

Applying probability calculations to hashing and load balancing.

Probability distributions:

Discrete probability distribution of the binomial distribution.

Continuous probability distribution of the normal (Gaussian) distribution.

LO3 Determine solutions of graphical examples using geometry and vector methods

Geometry:

Cartesian co-ordinate systems in two dimensions. Representing lines and simple shapes using co-ordinates. The co-ordinate system used in programming output device.

Vectors:

Introducing vector concepts.

Cartesian and polar representations of a vector. Scaling shapes described by vector co-ordinates.

LO4 Evaluate problems concerning differential and integral calculus

Differential calculus:

Introduction to methods for differentiating mathematical functions. The use of stationary points to determine maxima and minima.

Using differentiation to assess rate of change in a quantity.

Integral calculus:

Introducing definite and indefinite integration for known functions. Using integration to determine the area under a curve.

Formulating models of exponential growth and decay using integration methods.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
L01 Use applied number theory in practical computing scenarios		D1 Produce a detailed written explanation of the importance of prime numbers in the field of computing.
<p>P1 Calculate the greatest common divisor and least common multiple of a given pair of numbers.</p> <p>P2 Use relevant theory to sum arithmetic and geometric progressions.</p>	M1 Identify multiplicative inverses in modular arithmetic.	
L02 Analyse events using probability theory and probability distributions		D2 Evaluate probability theory to an example involving hashing and load balancing.
<p>P3 Deduce the conditional probability of different events occurring in independent trials.</p> <p>P4 Identify the expectation of an event occurring from a discrete, random variable.</p>	M2 Calculate probabilities in both binomially distributed and normally distributed random variables.	
L03 Determine solutions of graphical examples using geometry and vector methods		D3 Construct the scaling of simple shapes that are described by vector co-ordinates.
<p>P5 Identify simple shapes using co-ordinate geometry.</p> <p>P6 Determine shape parameters using appropriate vector methods.</p>	M3 Evaluate the co-ordinate system used in programming a simple output device.	

Pass	Merit	Distinction
LO4 Evaluate problems concerning differential and integral calculus		D4 Justify, by further differentiation, that a value is a minimum.
P7 Determine the rate of change in an algebraic function. P8 Use integral calculus to solve practical problems involving area.	M4 Analyse maxima and minima of increasing and decreasing functions, using higher order derivatives.

Unit 18: Discrete Maths

Unit 33: Applied Analytical Models.

Unit 16: Computing Research Project (Pearson-set)

Unit code K/618/7425

Unit type Core

Unit level 5

Credit value 30

Introduction

This unit is assessed through a Pearson-set assignment. Students will choose their own project based on a theme provided by Pearson (this will change annually). The project must be related to their specialist pathway of study (unless the student is studying the general computing pathway). This will enable students to explore and examine a relevant and current topical aspect of computing in the context of a business environment and their chosen specialist pathway.

The aim of this unit is to give students the opportunity to engage in sustained research in a specific field of study. Students will be able to demonstrate the capacity and ability to identify a research theme, to develop research aims, objectives and outcomes, and to present the outcomes of such research in both written and verbal formats. Students are encouraged to reflect on their engagement in the research process, during which recommendations for personal development are key learning points.

On successful completion of this unit, students will have the confidence to engage in problem-solving and research activities. Students will have fundamental knowledge and skills that will enable them to investigate workplace issues and problems, determine appropriate solutions and present evidence to various stakeholders in an acceptable and understandable format.

Students will have developed skills such as communication literacy, critical thinking, analysis, synthesis, reasoning, and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Examine appropriate research methodologies and approaches as part of the research process
- LO2 Conduct and analyse research relevant to a computing research project
- LO3 Communicate the outcomes of a research project to identified stakeholders
- LO4 Reflect on the application of research methodologies and concepts.

Essential Content

LO1 **Examine appropriate research methodologies and approaches as part of the research process**

Developing a research proposition:

The importance of developing methodical and valid propositions as the foundation for a research project.

Rationale: the purpose and significance for research question or hypothesis.

The value of the philosophical position of the researcher and the chosen methods.

Use of Saunders' Research Onion as a guide to establishing a methodological approach.

Literature review:

Conceptualisation of the research problem or hypothesis.

The importance of positioning a research project in context of existing knowledge.

Significance and means of providing benchmarks by which data can be judged.

Qualitative, quantitative, and mixed method research methodologies:

Key theoretical frameworks for research.

Advantages and limitations of qualitative and quantitative research approaches and methods.

LO2 **Conduct and analyse research relevant to a computing research project**

Research as a process:

Follow distinct phases of research to support a coherent and logical argument including using secondary research to inform a primary, empirical study.

Identify the reason and goal of the business research project, e.g. solving identified problems, business expansion, improve competitiveness, response to developments in technology, changes in the industry.

Elicite information from stakeholders.

Application of key skills and behaviours to guide the research project and ensure success, e.g. critical thinking, analysis and reasoning, dealing with difficult situations, misunderstanding or mistakes.

Selecting a sample:

The importance of gathering primary and secondary data and information (qualitative or quantitative) to support research analysis.

Selecting sample types and sizes that are relevant to the research.

Considering sampling approaches and techniques, including probability and non-probability (random) sampling.

Ethics, reliability and validity:

Conduct research ethically including reporting of findings.

Consider how to ensure reliable and valid research.

Analysing data:

Using data collection tools such as interviews and questionnaires.

Using analytical techniques such as trend analysis, coding and typologies.

LO3 Communicate the outcomes of a research project to identified stakeholders

Stakeholders:

Techniques to support the identification and analysis of internal and external stakeholders.

Stakeholder analysis to determine approaches to communications, including who the stakeholders are, high and low priority status, type of communication, frequency of communication, level to which the project outcomes are conveyed.

Communicating research outcomes:

Consideration of different methods of communicating outcomes, e.g. written word, spoken word, and the medium, e.g. report, online, presentation. The method and medium will be influenced by the research and its intended audience.

Considerations when communicating with stakeholders, e.g. maintaining privacy and security, tone of voice, use of technical vocabulary or jargon, maintaining or promoting company image.

Convincing arguments:

No matter what the method/medium, all research should be convincing and presented logically where the assumption is that the audience has little or no knowledge of the research process.

The importance of developing evaluative conclusions.

LO4 **Reflect on the application of research methodologies and concepts**

Reflection for learning and practice:

Difference between reflecting on performance and evaluating a research project. The former considers the research process; the latter considers the quality of the research argument and use of evidence.

Reflection on the merits, limitations and potential pitfalls of the chosen methods.

The cycle of reflection:

To include reflection in action and reflection on action.

Considering how to use reflection to inform future behaviour and future considerations.

Reflective writing:

Avoiding generalisation and focusing on personal development and the research journey in a critical and objective way.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine appropriate research methodologies and approaches as part of the research process		D1 Critically evaluate research methodologies and processes in application to a computing research project to justify chosen research methods and analysis.
P1 Produce a research proposal that clearly defines a research question or hypothesis, supported by a literature review.	M1 Analyse different research approaches and methodology and make justifications for the choice of methods selected based on philosophical/theoretical frameworks.	
P2 Examine appropriate research methods and approaches to primary and secondary research.		
LO2 Conduct and analyse research relevant to a computing research project		
P3 Conduct primary and secondary research using appropriate methods for a computing research project that consider costs, access and ethical issues.	M2 Discuss merits, limitations and pitfalls of approaches to data collection and analysis.	
P4 Apply appropriate analytical tools, analyse research findings and data.		

Pass	Merit	Distinction
LO3 Communicate the outcomes of a research project to identified stakeholders		D2 Evaluate outcomes and make valid, justified recommendations.
P5 Communicate research outcomes in an appropriate manner for the intended audience.	M3 Analyse the extent to which outcomes meet set research objectives and communicate judgements effectively for the intended audience	
LO4 Reflect on the application of research methodologies and concepts		D3 Demonstrate reflection and engagement in the resource process, leading to recommended actions for future improvement.
P6 Discuss the effectiveness of research methods applied, for meeting objectives of the computing research project. P7 Discuss alternative research methodologies and lessons learnt in view of the outcomes.	M4 Analyse results in recommended actions for improvements and future research considerations.

Introduction

Data and information are core to any organisation and business process. Accurate data and meaningful information are of high value to an organisation and are key drivers for effective decision making and problem solving. Business intelligence relies on the use of data science, which makes use of a range of tools and methods, including data mining, data integration, data quality and data warehousing, in conjunction with other information management systems and applications.

This unit introduces students to a range of tools, techniques and technologies used for acquiring data and processing it into meaningful information that can be used to support business functions and processes.

Students will examine how data and information support business processes, the mechanisms to source and utilise data and turn it in to usable, and valuable, information output. Students will explore real-world business problems, the emergence of data science and how the application of data science can be used to support business processes. Finally, students will demonstrate practical application of data science techniques to support real-world business problems.

On successful completion of this unit, students will appreciate the importance and value of data and information in terms of optimising decision making and performance. By exploring the tools, techniques and systems that support business processes, students will be aware of the role and contribution of these technologies and methodologies, and their importance to organisations. As a result, students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Discuss the use of data and information to support business processes and the value they have for an identified organisation
- LO2 Discuss the implications of the use of data and information to support business processes in a real-world scenario
- LO3 Explore the tools and technologies associated with data science and how it supports business processes
- LO4 Demonstrate the use of data science techniques to make recommendations to support real-world business problems.

Essential Content

LO1 Discuss the use of data and information to support business processes and the value they have for an identified organisation

Data and information in organisations:

Value of data and information for an organisation, including decision making (strategic, tactical and operational), deliver and improve services, optimise workflow and efficiency, increase profit margins, diversification, reduce overheads.

Types of data used by organisations, including structured and unstructured data.

Impact on business processes in terms of elicitation and storage.

The importance of reliable data and impact on businesses.

Use of data and information to support business processes:

Analysing market trends to identify patterns.

Factors impacting fluctuations in supply and demand, and prices of goods.

Monitoring system performance metrics.

Monitoring and controlling the quality of a product or service.

Analysing levels of user or customer interaction and engagement.

Analysing trends in browsing and purchasing for targeted marketing purposes.

Mechanisms:

Data generation, including human generated, e.g. social media posts, documents and files, email and text messages, website content.

Machine generated data, e.g. sensor readings, log files, system performance metrics, transactional data.

Tools to collect, store, manage, analyse and display data and information, including application software, content management systems, social media platform analytics tools, databases, scripting languages.

LO2 **Discuss the implications of the use of data and information to support business processes in a real-world scenario**

Social, legal and ethical implications:

Recognise the social, ethical and professional issues related to the use of data and information to support business processes, e.g. how data and information is collected and used, use of cookies and other transactional data, sharing of data, e.g. between departments, services and organisations.

Legal and regulatory issues related to the use of data and information to support business processes in reference to current legislation and principles of good practice, as recommended by computing professional bodies.

Cybersecurity management:

Common threats to data and information, e.g. internal and external threats.

Impact of human behaviour on cyber security, e.g. how motive and opportunity combine to become a threat.

Concept of 'secure by design' when developing and using systems to handle data and information.

Ways to mitigate common threats to data and information at personal and organisational level.

Organisational implications of failing to adequately protect data and information, e.g. legal actions, financial impact, disruption of operations and reduction in productivity, damage to public image.

LO3 **Explore the tools and technologies associated with data science and how it supports business processes**

Data science overview:

Explore how the exponential growth of the amount of data generated impacts on the way data is collected and used.

The core aims of data science, including making data useful and retrievable, extracting actionable intelligence to improve business performance, automating extraction and implementation.

Key job roles, including data engineer and data scientist, and how they work with other members of a team, e.g. senior managers, business and data analysts, software engineers in change and development lifecycles.

Data-science-related skills, including mathematics and statistics, programming and scripting skills, investigation and integration of data, core business knowledge.

Sub-disciplines in the data science field, including data engineering, machine learning and artificial intelligence.

Using data:

Core data handling techniques and concepts, including input and capture, data processing and conversion, information output and security considerations.

Forms of data, including unstructured and semi-structured data, and implications on use and analysis.

Data types, e.g. date, integer, real, character, string, Boolean.

Format of source and target data files, e.g. JSON, fixed-width text file, CSV, ASCII, XML.

The use of coding and scripting languages to automate data science processes, e.g. Python, R.

Turning data into usable information, including data mining techniques to find anomalies, cluster patterns and relationships between data sets, web scraping, descriptive and predictive analysis, converting data into visual information, e.g. charts, graphs, histograms, other visual mediums.

Predictive modelling, e.g. forecasting, use of statistical models to predict and identify trends.

Communicating information effectively to a range of stakeholders.

LO4 Demonstrate the use of data science techniques to make recommendations to support real-world business problems

Solutions:

Supporting a business process, including techniques to elicit end user requirements, systems requirements, application to automate procedures, including when it is most appropriate to use each one.

Designing a tool, program or package that can perform a specific task to support problem solving or decision making, e.g. e-commerce function for a website to support purchase analysis, a user dashboard to investigate specific market trends, optimising delivery routes for a logistics company.

Analysing and modelling business processes using relevant techniques, standards, notation and software tools.

Design considerations:

Addressing user and system requirements, e.g. user-friendly and functional interface, considering user engagement and interaction, quality risks inherent in data, mitigate or resolve risks, meaningful data output, customisation to satisfy the user and system requirements, phases of testing of business system changes.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Discuss the use of data and information to support business processes and the value they have for an identified organisation		D1 Evaluate the wider implications of using data and information to support business processes in an identified organisation.
<p>P1 Discuss how data and information support business processes and the value they have for organisations.</p> <p>P2 Discuss how data is generated and the tools used to manipulate it to form meaningful data to support business operations.</p>	M1 Assess the value of data and information to individuals and organisations in relation to real-world business processes.	
LO2 Discuss the implications of the use of data and information to support business processes in a real-world scenario		
<p>P3 Discuss the social legal and ethical implications of using data and information to support business processes.</p> <p>P4 Describe common threats to data and how they can be mitigated at on a personal and organisational level.</p>	M2 Analyse the impact of using data and information to support business real-world business processes.	

Pass	Merit	Distinction
LO3 Explore the tools and technologies associated with data science and how it supports business processes		D2 Evaluate the use of data science techniques against user and business requirements of an identified organisation.
P5 Discuss how tools and technologies associated with data science are used to support business processes and inform decisions.	M3 Assess the benefits of using data science to solve problems in real-world scenarios.	
LO4 Demonstrate the use of data science techniques to make recommendations to support real-world business problems		
P6 Design a data science solution to support decision making related to a real-world problem. P7 Implement a data science solution to support decision making related to a real-world problem.	M4 Make justified recommendations that support decision making related to a real-world problem.

Introduction

Digital computer technologies operate with distinct steps and data is stored as separate bits. This method of finite operation is known as 'discrete', and the division of mathematics that describes computer science concepts such as software development, programming languages and cryptography is known as 'discrete mathematics'. This branch of mathematics is a major part of a computer science course and aids, ultimately, in the development of logical thinking and reasoning that lies at the core of all digital technology.

This unit introduces students to the discrete mathematical principles and theory that underpin software engineering. Through a series of case studies, scenarios and task-based assessments, students will explore set theory and functions in a variety of scenarios, perform analysis using graph theory, apply Boolean algebra to applicable scenarios and, finally, explore additional concepts in abstract algebra.

Among the topics included in this unit are set theory and functions, Eulerian and Hamiltonian graphs, binary problems, Boolean equations, algebraic structures and group theory.

On successful completion of this unit, students will have gained confidence in the discrete mathematics that is needed to understand software engineering concepts. As a result, they will have developed skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Examine set theory and functions applicable to software engineering
- LO2 Analyse mathematical structures of objects using graph theory
- LO3 Investigate solutions to problem situations using the application of Boolean algebra
- LO4 Explore applicable concepts within abstract algebra.

Essential Content

LO1 Examine set theory and functions applicable to software engineering

Set theory:

Sets and set operations. Algebra within set theory.

Set identities and proof of identities. Bags manipulation functions.

Functions:

Domain, range and mappings.

Inverse relations and the inverse function. Injective and surjective functions, and transitive relations

LO2 Analyse mathematical structures of objects using graph theory

Graph theory:

Structure and characterisation of graphs. Spanning trees and rooted trees.

Eulerian and Hamiltonian graphs. Vertex and edge colourings of graphs.

Directed graphs:

Directed and undirected graphs.

Walks, trails, paths and shortest paths.

LO3 Investigate solutions to problem situations using the application of Boolean algebra

Boolean algebra:

Binary states (e.g. on/off; 1/0; open/closed; high/low).

Identification of binary problems and labelling inputs and outputs. Production of a truth table corresponding to a problem situation.

Equations:

Express a truth table as a Boolean equation.

Simplify a Boolean equation using algebraic methods. Represent a Boolean equation using logic gates.

LO4 Explore applicable concepts within abstract algebra

Algebraic structures:

Binary operations and associated properties. Commutative and associative operations.

Algebraic structures and substructures.

Groups:

Introduction to groups, semigroups and monoids. Families of groups and group codes.

Substructures and morphisms.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine set theory and functions applicable to software engineering		D1 Formulate corresponding proof principles to prove properties about defined sets.
P1 Perform algebraic set operations in a formulated mathematical problem. P2 Determine the cardinality of a given bag (multiset).	M1 Determine the inverse of a function using appropriate mathematical techniques.	
LO2 Analyse mathematical structures of objects using graph theory		D2 Construct a proof of the Five Color Theorem.
P3 Model contextualised problems using trees, both quantitatively and qualitatively. P4 Use Dijkstra's algorithm to find a shortest path spanning tree in a graph.	M2 Assess whether a Eulerian and Hamiltonian circuit exists in an undirected graph.	

Pass	Merit	Distinction
L03 Investigate solutions to problem situations using the application of Boolean algebra		D3 Design a complex system using logic gates.
<p>P5 Diagram a binary problem in the application of Boolean algebra.</p> <p>P6 Produce a truth table and its corresponding Boolean equation from an applicable scenario.</p>	<p>M3 Simplify a Boolean equation using algebraic methods.</p>	
L04 Explore applicable concepts within abstract algebra		D4 Explore, with the aid of a prepared presentation, the application of group theory relevant to your given example.
<p>P7 Describe the distinguishing characteristics of different binary operations that are performed on the same set.</p> <p>P8 Determine the order of a group and the order of a subgroup in given examples.</p>	<p>M4 Validate whether a given set with a binary operation is indeed a group.</p>

Credit value	15

Introduction

Knowing how to implement algorithms and data structures that solve real problems, and knowing the purpose, complexity and use of algorithms is part of an essential toolkit for software engineers. An algorithm is a sequence of instructions used to manipulate data held in a structured form and together with data structures constitute design patterns for solving a diverse range of computer problems, including network analysis, cryptography, data compression and process control.

This unit introduces students to data structures and how they are used in algorithms, enabling them to design and implement data structures. Students are introduced to the specification of abstract data types and will explore their use in concrete data structures. Using this knowledge, students should be able to develop solutions by specifying, designing and implementing data structures and algorithms in a variety of programming paradigms for an identified need.

Among the topics included in this unit are abstract data types specification, formal data notations, data encapsulation, complex data structures, programming language implementations using handles, pointers, classes and methods, algorithm types, data structure libraries, algorithm complexity, asymptotic testing and benchmarking.

On completion of this unit, students should be able to identify program data requirements, specify abstract data types using a formal notation, translate into concrete data structures and be able to develop, using a programming paradigm, different sorting, searching and navigational algorithms that implement complex data structures and evaluate their effectiveness. As a result, students will have developed skills such as communication literacy, critical thinking, analysis, synthesis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of the unit students will be able to:

- LO1 Examine abstract data types, concrete data structures and algorithms
- LO2 Specify abstract data types and algorithms in a formal notation
- LO3 Implement complex data structures and algorithms
- LO4 Assess the effectiveness of data structures and algorithms.

Essential Content

LO1 Examine abstract data types, concrete data structures and algorithms

Abstract Data Types (ADTs):

Specification of ADTs with formal notation.

Data structures:

Array, set, stack, queue, list, tree, types, e.g. active, passive, recursive.

Algorithm types:

Recursive, backtracking, dynamic, divide and conquer, branch and bound, greedy, randomised, brute force.

Algorithms:

Sort, insertion, quick, merge, heap, bucket, selection, search linear, binary, binary search tree, recursive, e.g. binary tree traversals, find path, travelling salesman.

LO2 Specify abstract data types and algorithms in a formal notation

Design specification:

Specify ADTs using formal notation, e.g. ASN.1.

Use non-executable program specification language, e.g. SDL, VDM.

Issues, e.g. complexity in software development, design patterns, parallelism, interfaces, encapsulation, information hiding, efficiency.

Creation:

Pre-conditions, post-conditions, error-conditions.

LO3 Implement complex data structures and algorithms

Implementation:

Apply algorithms, logic and data structures, multidimensional arrays, linked lists, stacks, queues, trees, hash table, heap, graph algorithms, sorting, searching, tree traversal, list traversal, hash functions, string manipulation, scheduling and recursive algorithms, using handle, pointer, class, methods, using an executable programming language.

Create logical and maintainable codes.

Testing and debugging:

Testing code to ensure it is secure and can handle user errors, identifying and creating test scenarios, applying structured techniques to problem solving, debugging code, understanding the structure of programmes to identify and resolve issues.

LO4 Assess the effectiveness of data structures and algorithms

Use of data structure libraries (DSL):

Limitations of DSL, manual selection of data structures, theoretical analysis, asymptotic analysis, size of N, Big O notation.

Algorithm effectiveness:

Run time benchmark, compiler/interpreter dependencies, resource usage, degree of parallelism, time, space, power performance, efficiency of garbage collection.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
L01 Examine abstract data types, concrete data structures and algorithms		D1 Analyse the operation, using illustrations, of two network shortest path algorithms, providing an example of each.
<p>P1 Create a design specification for data structures, explaining the valid operations that can be carried out on the structures.</p> <p>P2 Determine the operations of a memory stack and how it is used to implement function calls in a computer.</p>	<p>M1 Illustrate, with an example, a concrete data structure for a First in First out (FIFO) queue.</p> <p>M2 Compare the performance of two sorting algorithms.</p>	
L02 Specify abstract data types and algorithms in a formal notation		D2 Discuss the view that imperative ADTs are a basis for object orientation offering a justification for the view.
P3 Specify the abstract data type for a software stack using an imperative definition.	M3 Examine the advantages of encapsulation and information hiding when using an ADT.	

Pass	Merit	Distinction
LO3 Implement complex data structures and algorithms		D3 Critically evaluate the complexity of an implemented ADT/algorithm.
<p>P4 Implement a complex ADT and algorithm in an executable programming language to solve a well-defined problem.</p> <p>P5 Implement error handling and report test results.</p>	<p>M4 Demonstrate how the implementation of an ADT/algorithm solves a well-defined problem.</p>	
LO4 Assess the effectiveness of data structures and algorithms		D4 Evaluate three benefits of using implementation independent data structures.
<p>P6 Discuss how asymptotic analysis can be used to assess the effectiveness of an algorithm.</p> <p>P7 Determine two ways in which the efficiency of an algorithm can be measured, illustrating your answer with an example.</p>	<p>M5 Interpret what a trade-off is when specifying an ADT, using an example to support your answer.</p>

Introduction

The advanced features of programming languages are used to develop software that is efficient, robust and can be mathematically proven to work. Well-designed code can positively impact the performance of an application as well as the readability and extensibility of the code, thereby improving productivity and reducing cost.

Effective object orientated programming (OOP) should have low coupling, high cohesion and strong encapsulation, which is something that the SOLID principles help to obtain. The idea is that by applying those principles together, it makes it easier to write better quality code with greater diversity and robustness. The system created becomes easy to maintain, to reuse and to extend over time. SOLID principles help software developers to achieve scalability and avoid creating code that breaks every time it needs a change. Clean coding maintains the readability of the programs produced by encouraging descriptive naming of objects and keeping to a single purpose model for each entity. Programming patterns work to ensure that designs produced are language independent, encapsulate ideas and are reusable in multiple circumstances.

The development of an application to process a large data set is a practical example of how to solve a problem that can be used in many different situations, can help deepen the understanding of OOP and help improve software design and reusability.

The aim of this unit is to familiarise students with these concepts and their best practices to ensure that their code is in line with industry standards. Among the topics included in this unit are object-orientated programming, introduction to design patterns and SOLID, including its version of five principles of object-oriented programming and automated software testing.

The unit is especially useful for those intending to move into computer science, software development, programming, systems analysis and software testing.

Learning Outcomes

By the end of this unit, students will be able to:

- LO1 Investigate the impact of SOLID development principles on the OOP paradigm
- LO2 Design a large dataset processing application using SOLID principles and clean coding techniques
- LO3 Build a data processing application based on a developed design
- LO4 Perform automatic testing on a data processing application.

Essential Content

LO1 Investigate the impact of SOLID development principles on the OOP paradigm

Object-orientated programming (OOP) paradigm characteristics:

Understand the OO characteristics and their application in developing code, including encapsulation, polymorphism, constructors and destructors, sub-objects, abstraction, interface, method overriding and redefinition, templates and containers.

Object-orientated class relationships:

Understand the elements of the OO relationships, including generalisation and inheritance, realisation, dependency, aggregation and composition.

Design patterns:

Aims and benefits of reusable design patterns, e.g. general reusable solution, represent an idea and language independent.

Grouping of design patterns into creational, structural and behavioural groups.

Clean coding techniques:

Simple design, e.g. keeping configurable data at high levels, polymorphism, consistency in methods, meaningful variable and constant names and encapsulate boundary conditions.

Creating small functions by including single action, minimal parameters, descriptive names, comments to explain code and warn of consequences.

Structure source code to separate concepts vertically, declare variables close to usage and keep lines short.

Develop objects and data structures for one action so that they are small.

Understand why non-static methods are preferable to static methods.

Design tests to ensure they are readable, fast and independent.

Understand bad test design, e.g. rigid, fragile, immobile, complex, repetitive.

SOLID design principles:

Understand and apply the component parts of SOLID design principles to make software understandable, flexible and maintainable, including Single-responsibility principle, Open-closed principle, Liskov substitution principle, Interface segregation principle and Dependency inversion principle.

LO2 **Design a large dataset processing application using SOLID principles and clean coding techniques**

Large datasets (public domain):

Design of application that can accommodate pre-existing large (500+) datasets, e.g. list of members of parliament, register of members' interests (Commons and Lords), list of public domain films (e.g. in the USA), list of public domain books, list of public domain music.

Data structures:

Use of data structures in application development, e.g. stack, array, multi-dimensional array, set, queue, list and linked list.

Apply tree types, including active, passive and recursive.

Operations:

Use of operations in application development, e.g. hash functions and pointers.

Utilise sorts, e.g. insertion, quick, merge and heap.

Utilise searches, e.g. linear, binary tree and recursive.

LO3 **Build a data processing application based on a developed design**

Implementation:

Utilise an appropriate language and development tools, incorporate security and maintainability expectations.

Produce program code that implements a design based on SOLID principles, clean coding techniques and programming patterns.

Understand and interpret design features, meet requirements, input, output, processing security, portability and maintainability.

LO4 **Perform automatic testing on a data processing application**

Types of automatic testing:

Understand the uses of automation in setting up regression tests, data set up generation, product installation, GUI interaction, defect logging, unit testing and integration testing of main application.

Tool automation parameters:

Understand the meaning of data driven capabilities, debugging and logging capabilities, platform independence, extensibility and customisability, email notifications, version control friendly.

How automated testing features support unattended test runs.

Understanding of testing logic and updates code to make testing easier through the use of stubbing/patching.

Follow common testing frameworks and methodologies:

Understand the circumstances where different frameworks perform best, Data Driven Automation Framework, Keyword Driven Automation Framework, Modular Automation Framework and Hybrid Automation Framework.

Tools:

Investigate a range of tools that are commercially available.

Functional, e.g. QuickTest Professional (HP), Coded UI (Microsoft), Selenium, Open IT (open source).

Non-functional, e.g. LoadRunner (HP), JMeter (Apache), Burp Suite (PortSwigger).

Self-built testing tools:

Investigate the value of developer-designed and built tools to test features and functions of a specific application.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Investigate the impact of SOLID development principles on the OOP paradigm		D1 Evaluate the impact of SOLID development principles on object-orientated application development.
P1 Investigate the characteristics of the object-orientated paradigm, including class relationships and SOLID principles. P2 Explain how clean coding techniques can impact on the use of data structures and operations when writing algorithms.	M1 Analyse, with examples, each of the creational, structural and behavioural design pattern types.	
LO2 Design a large dataset processing application using SOLID principles and clean coding techniques		
P3 Design a large data set processing application, utilising SOLID principles, clean coding techniques and a design pattern. P4 Design a suitable testing regime for the application, including provision for automated testing.	M2 Refine the design to include multiple design patterns.	

Pass	Merit	Distinction
LO3 Build a data processing application based on a developed design		D2 Analyse the benefits and drawbacks of different forms of automatic testing of applications and software systems, with examples from the developed application.
P5 Build a large dataset processing application based on the design produced.	M3 Assess the effectiveness of using SOLID principles, clean coding techniques and programming patterns on the application developed.	
LO4 Perform automatic testing on a data processing application		
P6 Examine the different methods of implementing automatic testing as designed in the test plan. P7 Implement automatic testing of the developed application.	M4 Discuss the differences between developer-produced and vendor-provided automatic testing tools for applications and software systems.

Introduction

Raw data can be complicated, confusing and a challenge to understand. But when raw data is organised and structured properly it can reveal patterns and information that can be very powerful in business decision making. Without the ability to organise and visualise data, key information would otherwise remain hidden in raw data. Once a business can understand historic patterns of data sets this information can help predict future trends and behaviours.

Data and visualisation is an area which has seen rapid advancement and there has been considerable challenges for data specialists to develop the skills, experience and growth required to maintain innovation in the sector. As data continues to be the fuel for the digital economy, this area remains a constant topic of conversation for organisations, governments and the public who share an interest in its growing commercial use, manipulation, and presentation.

This unit introduces students to the concepts of big data and visualisation and how this is used for decision making. It explores the industry software solutions available to investigate and present data, before assessing the role and responsibility of data specialists in this current environment. Topics including data driven decision-making, manipulating data and automation, and building ethics into a data-driven culture are examined. Students will demonstrate their use of tools and software to manipulate and prepare a visual presentation for a given data set. They will also assess how data specialists are responsible for adhering to legislation and ensuring data compliance.

On successful completion of this unit students will be able to investigate the value of data for decision making to both end users and organisations, compare how different industry leading tools and software solutions are used to analyse and visualise data, carry-out queries to summarise and group a given data set and analyse the challenges faced when building ethics into a data-driven culture. Students will have the opportunity to progress to a range of roles within the digital sector, and will develop industry-led skills, analysis, and interpretation, which are crucial for developing practical experiences with big data and gaining employment.

Learning Outcomes

By the end of this unit, students will be able to:

- LO1 Examine data visualisation for decision making of complex data sets
- LO2 Discuss statistical and graphical tools and techniques used to present big data for a given use case
- LO3 Demonstrate statistical and graphical techniques used to present big data as a visualisation
- LO4 Investigate the challenges faced by data professionals in carrying out their role.

Essential Content

LO1 Examine data visualisation for decision making of complex data sets

Big Data:

Explore common fundamental concepts e.g. Bayesian classification, rule-based classification, The 'Vs' of big data (Volume, Velocity, Variety, Variability, Veracity, Visualization, and Value).

Big data lifecycle to include purpose, capturing data, searching and filtering, retrieving data for processing, combining multiple data sources, validation and cleansing, visualisation, analysis and querying, utilisation and storage, obsolete and deleted data.

Visualisation:

Identify the target audience needs, e.g. context, reporting, dissemination, accessibility, breadth of data, depth of analysis.

Explain the phases of data visualisation design process to include formulating the brief, working with data, establishing editorial thinking and developing design solution.

Apply principles of good design to data visualisation e.g. Dieter Rams' Ten Principles for Good Design, Gestalt principles of visual perception and Pareto Chart.

Evaluate effective visual elements e.g. charts, graphs, plots, tables, points, lines, bars, area, maps, narratives, metaphors, symbols and aesthetics e.g. position, size, shape, colour and transparency.

Data for decision making:

Explore processes of data driven decision making (DDDM) e.g. define objective, establish hypothesis, identify data need, build data process, sampling methods, collect data, analyse data, interpret results and make decision.

The role of the Data Analysis Lifecycle as part of DDDM (e.g. Discovery, Data preparation, Model Planning, Model Building, Operationalise, Communicate results).

Discuss the advantages of data driven decision-making e.g. continuous improvement and planning, collaborative decisions, reduce costs, real-time insights and new opportunities, digital literacy and data-driven cultures.

Challenges e.g. inconsistent and unstandardised data, aligning decision making with business strategy, bias and discrimination, descriptive vs. predictive trends and probabilities.

LO2 **Discuss statistical and graphical tools and techniques used to present big data for a given use case**

Statistical and graphical techniques for big data analysis and visualisation:

Analyse and apply big data analytics techniques taking account of different data structures and database designs e.g. descriptive, prescriptive, diagnostic and predictive analytics.

Apply principles of mathematics and statistics for analysing data sets.

Explore the various kinds of analysis techniques e.g. anomaly detection, cluster, association by rule, classification and regression analysis.

Examine how to organise semi-structured and unstructured data variety e.g. word-cloud visuals, data catalogue, taxonomies and ontologies.

Forecasting estimates of future values e.g. applied forecasting and decision tree algorithms.

Industry leading tools and software solutions to analyse data:

Apply tools to analyse data e.g. programming or scripting languages such as Python or R and associated libraries, Application Programming Interfaces (APIs).

Industry leading tools and software solutions to visualise data:

Apply leading tools to a solution e.g. Microsoft Excel, Tableau, PowerBI and Azure, AWS, Oracle Visual Analyzer, Qlikview, Canvas, SAS Visual Analytics.

Explore how user experience and domain context influences approaches to data analytics and visualisation.

LO3 **Demonstrate statistical and graphical techniques used to present big data as a visualisation**

Manipulating data:

Construct activities using industry software to manipulate data e.g. importing datasets, data cleansing, data frame manipulation, testing and training a model, summarising analysis process and steps taken.

Apply query basics e.g. reports, calculate aggregate statistics, use built-in functions summarising and grouping data.

Explore advanced data manipulation and automation concepts e.g. generalised linear models and regression, multilevel modelling and techniques, data pipelines, machine learning and deep reinforcement learning (DRL).

Prepare visual presentations:

Visual presentations to include using insight analysis to understand data in context, selecting visual elements and aesthetic design e.g. find and filter content in dashboards, view and export data from dashboards to create report, presentation or infographic.

Data set requirements:

Understanding the data and its context including summary of data collection, sampling procedures and data type; stakeholder requirements, interests and needs.

LO4 Investigate the challenges faced by data professionals in carrying out their role

Roles and responsibilities:

Explain roles in a data-driven industry e.g. data analyst, data scientist, data engineer, visualisation specialist, data administrator, business analyst, middle-managers and senior management teams.

Explore the responsibilities of a data specialist e.g. preparing, analysing, modelling, managing and visualising data, and storage and access rights.

Strategies to ensure data compliance:

Explain organisational data architecture, policies, standards and rules e.g. how data is stored, managed, used and disseminated.

Assess data protection, informed consent and privacy issues for compliance e.g. personally identifiable information, protected health information, General Data Protection Regulation (GDPR) rights obligations, enforcement and regulatory legal penalties.

Explore and select the most appropriate industry compliance management software tools e.g. Microsoft Compliance Manager, AWS Compliance, IBM DataOps.

Identify and escalate quality risks in data analysis with suggested mitigation or resolutions as appropriate.

Challenges for data specialists:

Understand challenges such as applying data governance framework to ensure value of outcomes, accountability, trust, collaboration, transparency, risks and security, and role of the data steward.

Explain how to guard from poor practice e.g. cherry picking, disclosure of assumptions, conflict of interest, bias from single view and/or choice of technique.

Risks and challenges to combining data from different sources in data analysis activity.

Develop ethics into a data-driven culture and joining community of good practice e.g. Data for Good Exchange (D4GX); Fairness, Accountability and Transparency in Machine Learning group (FAT/ML), Data Ethics Framework (gov.uk).

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine data visualisation for decision making of complex data sets		D1 Predict the potential impact of using complex data sets on both users and organisations for decision making.
P1 Explain the fundamental concepts of big data and its value in decision making for end users and organisations. P2 Examine the processes of data driven decision making (DDDM) when using complex data sets.	M1 Discuss the advantages and challenges to an organisation of using complex data sets for decision making.	
LO2 Discuss statistical and graphical tools and techniques used to present big data for a given use case		D2 Evaluate how well the chosen data preparation and manipulation methods, the tools selected, and the data derived will impact on business decision making for the given use case.
P3 Discuss statistical and graphical tools and techniques used in industry for big data manipulation and visualisation.	M2 Assess the suitability of industry leading tools and software solutions for analysing and visualising data for the given use case.	
LO3 Demonstrate statistical and graphical techniques used to present big data as a visualisation.		
P4 Demonstrate the use of data manipulation and automation to present a visualisation for a given user case.	M3 Interpret the findings derived from the data manipulation to support conclusions made.	
LO4 Investigate the challenges faced by data professionals in carrying out their role.		D3 Evaluate the impact of the key issues faced by data specialists when working in a data-driven culture.
P5 Investigate the different roles, responsibilities and key issues faced by data specialists in their day-to-day role.	M4 Review the different strategies used by data specialists to ensure data compliance.

Introduction

Organisations of all sizes need to protect their sensitive information from potential attackers, and simply having up-to-date firewalls, anti-virus and other infrastructure components is not enough to prevent breaches. All physical security devices, the teams who manage them, and the processes surrounding their management, need to be constantly monitored and evaluated to ensure that the organisation as a whole is protected. This is the concept behind an Information Security Management System (ISMS). An ongoing process to continually assess what the organisation deems its biggest threats, and what its most important assets are.

This unit introduces students to the basic principles of an ISMS and how businesses use them to manage the ongoing protection of sensitive information they hold effectively. There are many reasons for establishing an ISMS for an organisation, but one of the main goals is to enable the organisation to manage information security as a single entity, which can be monitored and continually improved on.

This unit covers information security management in a business context and will give students an understanding of how modern organisations manage the ongoing threats to their sensitive assets.

On successful completion of this unit, students will be able to describe what an ISMS is, how one is established, maintained and improved and describe the role that international standards play in developing an ISMS. Students will develop skills such as communication literacy, critical thinking, analysis, reasoning, and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Explore the basic principles of information security management
- LO2 Critically assess how an organisation can implement and maintain an Information Security Management System (ISMS)
- LO3 Appraise an ISMS and describe any weaknesses it may contain
- LO4 Examine the strengths and weaknesses of implementing ISMS standards.

Essential Content

LO1 Explore the basic principles of information security management

Principles of an ISMS:

What an ISMS is and why it is important to an organisation.

Policies, including privacy policy, acceptable use, information security, separation of duties and least privilege.

Internal and external risks, including impact, likelihood, quantitative, qualitative, vulnerabilities and threats.

Risk treatment, including avoid, transfer, accept or mitigate.

Managing compliance and stakeholders.

The role of a company's internal policies, including service level agreements (SLAs) with providers, impact on defining the scope and approach.

Use of recognised sources of threat intelligence and vulnerabilities to predict possible, current, and future threats, e.g. horizon scanning.

Key principles:

Understanding the key principles of an ISMS, including scope and boundaries, information classification, risk management methodology, risk treatment, statement of applicability, incident handling, physical security, controls that meet the organisation's business activity.

LO2 Critically assess how an organisation can implement and maintain an Information Security Management System (ISMS)

Implementing an ISMS:

Steps required to implement an ISMS, including creating a project mandate, initiation of the project, adopting a methodology for the ISMS, creating a management framework, identifying baseline security criteria, developing a risk management process, creating a risk treatment plan, measuring, monitoring and reviewing the results.

Planned design, including asset identification, stakeholder requirements, risk assessment, risk treatment planning, policy development, procedure development, senior management buy-in, audit (internal, external).

Maintaining an ISMS:

Elements and processes for maintaining an ISMS using a framework or an ISO standard, e.g. 27001, 27002.

Performance monitoring and continual improvement strategy.

LO3 Appraise an ISMS and describe any weaknesses it may contain

Appraising an ISMS:

Review ISMS documentation for potential weaknesses by examining audit and performance monitoring output, business impact analysis, review of current 'security culture' in the organisation.

Suggest improvements to an ISMS.

Planning an ISMS:

Business requirements, including strategic, functional and non-functional requirements of digital systems.

Impacts on the business, including interruption costs, cost of failure analyses, worst-case scenario, possibility of new impacts or vulnerabilities.

Audit and stages of audit for an ISMS:

Scoping and pre-audit survey, planning and preparation, fieldwork, analysis, reporting.

LO4 Examine the strengths and weaknesses of implementing ISMS standards

Implementing ISMS standards:

Determining ISMS scope, including leadership commitment, policy, organisational roles and responsibilities, actions to address risks, information security objectives.

Resources and competence, awareness, communications, documented information, operational planning, risk assessment, risk treatment, monitoring, measuring, analysis and evaluation.

Management review and taking nonconformity and corrective action, as well as continual improvement.

Key purpose of ISO standards:

ISO 27001:2013; the organisation and its context, expectations of interested parties.

Advantages and disadvantages of ISO 27001:2013 certification, annex A (ISO 27002:2013) controls, ISO 8000 and data standards.

Examination of principles and good practice recommended by computing professional bodies and their impact on organisational compliance.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Explore the basic principles of information security management		D1 Critically analyse what is required to establish and maintain an ISMS for a selected organisation, ensuring that the key principles are met.
P1 Examine the key principles of an ISMS and its relevance to the successful operation of an organisation.	M1 Analyse the benefits an effective ISMS can have on an organisation.	
LO2 Critically assess how an organisation can implement and maintain an Information Security Management System (ISMS)		
P2 Assess the elements and processes required to establish and maintain an ISMS.	M2 Justify the steps required for implementing an ISMS for a selected organisation.	
LO3 Appraise an ISMS and describe any weaknesses it may contain		D2 Critically examine the advantages and disadvantages of the planned ISMS against the key ISO and international standards.
P3 Plan the design of an ISMS for a selected organisation, including an implementation map.	M3 Justify the planned ISMS design for a selected organisation by following the stages of audit.	
P4 Appraise the planned ISMS designed, against the organisational requirements.		
LO4 Examine the strengths and weaknesses of implementing ISMS standards		
P5 Recognise the purpose of the key ISO and international ISMS standards.	M4 Analyse the relationship between ISO standards and establishing an effective ISMS in an organisation.
